double-stranded cDNA was ligated to Sal I adaptors (BRL), digested with Not I and cloned into the Not I and Sal I sites of the pSPORTI vector (BRL). Library was constructed by Matthew Clark (Lehrach lab: ICRF, London and Max Planck Institut fuer Molekulare Genetik, Berlin). CDNAs for EST analysis were selected following oligonucleotide hybridization fingerprinting of arrayed clones from zebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta, euphyllophytes, Spermatophyta, Magnoliophyta; Liliopsida, Poales; Poaceae, Oryza.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         COMMENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
normalized libraries constructed from rat hippocampus, thalamus, mid-brain, medulla, corpus striatum, cerebral cortex and testis. The tag used to identify the source tissue is a string of 3-6 nuclectides present between the NoI site and the oligo-dT track which allows the nitreation of the library of origin of a clone within the mixture. This library was then subtracted using a driver consisting of a mixture of all clones from UI-R-AI, UI-R-ED, UI-R-EI, UI-R-CO, UI-R-CI, UI-R-CI and UI-R-CEP.

The sequence contained an oligo-dT track that was present in the
oligonuclectide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
trail. The sequence tag present in the CDNA between the NotI site
and the oligo-dT track served to identify it as a clone from the
normalized brain library cDNA Library Preparation: M.B. Soares Lab
Glone distribution: clones will be available through Research
Genetics (www.resgen.com) The following repetitive elements were
found in this cDNA sequence: 1-34, >AT_rich#Low_complexity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /dev_stage="adult"

kidney, heart, spleen, ovary, muscle, and 8, 12 and 18-day embryos, after a series of subtractions to reduce the representation of CDNAs from which ESTS had already been generated. The following serially subtracted libraries were generated in this process: UI-R-C3, UI-R-C2p, UI-R-C4, UI-R-C0, UI-R-C3, UI-R-C3, UI-R-C2p, UI-R-C4, UI-R-C4), UI-R-C4, UI-R-C4), UI-R-C4, UI-R-C4), UI-R-C5, UI-R-C5), UI-R-C5, UI-R-C5), uI-R-C5, UI-R-C5), uI-R-C5, UI-R-C5), was constructed as follows: Porsamplified contain of a clone within themixture. The subtracted library (UI-R-C3) was constructed as follows: Porsamplified contain of a clone within themixture. The subtracted library (UI-R-C3) was constructed as follows: Porsamplified been derived was used as a driver in a hyporialization with the UI-R-C2P library in the form of single-stranded circles (subtracted library) was purified by hydroxyapatic column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (LifeTechnologies) to generate the UI-R-C3 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6:791-806, 1996).

with an oligo(dT) primer [ArgraGcCTTTTTTTTTTTTT];
double-stranded cDwa was ligated to a Dralli adaptor
[TGTTGGCTACTGG], digested and cloned into distinct Dralli
sites of the pMERS-Fi3 vector (5' site CACTGTGTG, 3' site
CACCATGG). Xhol should be used to isolate the cDwa
insert. Size selection was performed to exclude fragments
<1.5kb. Library constructed by Dr. Sumlo Sugano
(University of Tokyo Institute of Medical Science).

HindIII; Rice is one of two most popular grains in the world. HindIII; Rice as one of two most popular grains in the world. HindIII; Rice as one of two most popular grains in the world. HindIII; Rice as their primary source of and subtropics, rely on rice as their primary source of carbohydrate. Monocytyledonous rice is a diploid plant (2n-24) with a haploid genome equivalent of 431 Mbp (Arumagnashan and Barle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice we have constructed a BAC library from oryza sativa, Nipponbare variety. The library contains 36,864 clones with an average insert size of 128.5 Kb providing 10,919 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."

It currently consists of 14 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100825: contig of 100825 bp in length

Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur epm.corn.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge,

Washington), Genscan (Chris Burge,

(http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), and NetPlantGene

(http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), asearches of the complete sequence against a peptide database and the Arabidopsis BST database at TiGR (http://www.tigr.corg/tdb/art/ar.html).

Annotated genes are named to indicate the level of evidence for their annotation Genes with similarity to other proteins are named after the database ints. Genes without significant peptide after the database ints. Genes without significant peptide after the database ints. Genes without protein or EST similarity are named as 'nypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.wustl.edd/dy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RN/RepeatMasker.html). Regions of genomic sequence that are nonotated as misc features.

BAC clone T29E15 is from Arabidopsis chromosome II and is contained
in the YAC clone CIC06C07.
The orientation of the sequence is from SP6 to T7 end of the BAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /protein_id="AAC63655.1"
